ATAQUE A TWITTER Y OTRAS COMPAÑÍAS &gt;

# Varios ciberataques masivos inutilizan las webs de grandes compañías

Son los más graves de la última década. Los primeros indicios descartan a un país extranjero

 BEATRIZ GUILLÉN | JOAN FAUS  | ROSA JIMÉNEZ CANO  

Madrid / Washington / San Francisco - 22 OCT 2016 - 19:01 CEST

Mapa con los puntos del planeta con problemas, según la web especializada Downdetector. ATLAS

Una oleada de ciberataques masivos contra el proveedor de Internet Dyn interrumpieron este viernes el servicio de páginas web de grandes compañías y medios de comunicación internacionales, como Twitter, Spotify, Amazon, Netflix o *The New York Times*. El ataque, planeado en varias fases, duró casi 11 horas.

# Fallo de seguridad en WordPress expone a millones de webs

Actualizado 11/05/2015 11:29:00 CET

MADRID, 10 May. (Portaltic) -

Un grupo de especialistas en seguridad informática ha descubierto recientemente una **vulnerabilidad de seguridad** en los sistios Web construidos en **WordPress**. El problema afectaría a una serie de **complementos y temas** preinstalados en la plataforma, que permitiría a un atacante **tomar el control de la web**.

Entre los afectados se encuentra "TwentyFifteen", mítico tema preinstalado con la plataforma web. Pero no ha sido el único, sino que **gadgets y pluggings** también se han visto afectador por este **fallo Cross-site o XSS**.

## Relacionadas

- Twitter quiere comprar la app de noticias Circa
- El sistema de pago móvil de Microsoft, HTC One M9 Plus y la falta de navegador web de Apple Watch:historias del día
- ¿Por qué "adgimptw" es una contraseña tan mala como "123456"?

Este tipo de fallos permite a un posible atacante **insertar códigos** que le permitirían tomar el **control del sitio**. Entre las formas que los ciberdelincuentes tienen de conseguir esto, esta la clásica práctica de **mandar un correo electrónico** en el que la víctima abra un enlace.

Por suerte el problema ya ha sido resuelto y **WordPress** ha lanzado ya la **actualización 4.2.2**, que soluciona esta vulnerabilidad de seguridad.

Desde **Portaltic** recomendamos a todos los propietarios de un blog o sitio web

WEBSITE EXPLOITS GO WILD —

# Mass exploit of WordPress plugin backdoors sites running Joomla, Magento, too

MailPoet attacks commandeer an estimated 30,000 to 50,000 sites, researcher says.

DAN GOODIN - 7/23/2014, 10:56 PM

As many as 50,000 websites have been remotely commandeered by attackers exploiting a recently patched vulnerability in a popular plugin for the WordPress content management system, security researchers said Wednesday.

As [Ars reported in early July](#), the vulnerability in [MailPoet](#), a WordPress plugin with more than 1.7 million downloads, allows attackers to upload any file of their choice to vulnerable servers. In the three weeks since then, attackers have exploited the bug to install a backdoor on an estimated 30,000 to 50,000 websites, some that don't even run WordPress software or that don't have MailPoet enabled, according to Daniel Cid, CTO of security firm Sucuri.

#### FURTHER READING

[WordPress plugin with 1.7 million downloads puts sites at risk of takeover](#)

"To be clear, the MailPoet vulnerability is the entry point," he wrote in a [blog post](#). "It doesn't mean your website has to have it enabled or that you have it on the website; if it resides on the server, in a neighboring website, it can still affect your website." In an e-mail to Ars, he elaborated:

“

The malware injection code is actually trying to compromise all PHP files that it can on the server. So if you have a site at `/var/www/site1.com` with MailPoet and another site at `/var/www/site2.com` without it, the malware injector from site1.com will try to compromise site2.com as well. We had a client that all his 20+ sites got injected, because one site inside the same shared account had MailPoet on it. That's why we were seeing Joomla and Magento sites with the same malware as well. Took us a bit of time to connect all the dots and find the entry point on them.

Sucuri researcher Peter Gramantik [first reported the mass exploitation affecting WordPress](#) Tuesday. The injected malware installs a backdoor account that gives attackers full administrative control. It also injects backdoor code into all themes and core files. Making matters worse, the malicious code also

## WP-Cron Trigger

MainWP relies on a built in WordPress file called wp-cron.php to trigger scheduled events.

However, since we suggest you install your MainWP Dashboard on a fresh dedicated site it will get almost no traffic which means your scheduled tasks such as backups and automatic updates may not be triggered in a timely manner.

In order to work around that we suggest you sign up for the free Uptime Robot service that will "visit" your dashboard site and make sure that Cron Jobs are regularly triggered.
